INDEPENDENT HEALTHCARE RESEARCH + PRODUCT STRATEGY PROJECT

India 2050 - The Future of Care

KAALJI - From care need to care delivered

I began by asking whether India would have enough caregivers as the population ages. The evidence changed the question: training, registration and functional need each describe different parts of the system. I mapped the missing steps and designed KAALJI, a proposed decision-support product for understanding what the evidence shows, what remains unknown, and what should be investigated next.

Core insight: Training caregivers is not the same as creating usable care capacity.

THE PROBLEM I REFRAMED

From “How many caregivers?” to “What happens in between?”

Care need -> family support -> formal support -> training -> registration -> employment -> availability -> affordability -> use -> retention + quality

PROPOSED USER

Healthcare / programme planning team

A team trying to understand why care is not reaching people as expected - and whether the real issue is training, employment, visibility, affordability, use, retention, or simply missing evidence.

WHAT I BUILT

Evidence model

Separated reported data, calculations, hypotheses and data gaps.

KAALJI prototype

Question -> evidence -> comparison check -> known/unknown -> next investigation.

AI responsibility model

AI assists search/explanation; rules protect evidence; people make decisions.

Validation plan

Tests whether context improves interpretation and changes the next action.

EVIDENCE DISCIPLINE

- 23.8% of adults 60+ in LASI Wave 1 had at least one ADL limitation; 48.0% had at least one IADL limitation.
- PM-SPECIAL reported 36,785 trainees across 32 institutes in FY2023-24.
- Training volume is treated as pipeline evidence - not active workforce supply.
- Functional need is not converted into paid-care demand.
- No national conversion rate, shortage, or LASI microdata result is claimed.

WHY THIS PROJECT MATTERS FOR MY CAREER TRANSITION

It demonstrates how I work at the intersection of clinical understanding, healthcare systems, research, product strategy, data interpretation and responsible AI. The strongest signal is not that I created a polished concept; it is that I changed the problem when the evidence challenged my original assumptions, then turned that reasoning into a testable product workflow.

Healthcare product | HealthTech strategy | Evidence synthesis | Systems thinking | AI product judgment | Experiment design
